Habitats that provide shelter & food for birds can be found in many forests, parks or even your backyard. Native flora is essential to a bird's well-being. Birds search for acorns, seeds and fruit in the boughs & branches of native trees & shrubs. Birds also hunt in & around these for invertebrates, such as slugs, worms & other insects.

Be a lifetime birder, like FDR. While a teenager he recorded bird sightings & became a member of the American Ornithologists' Union. While president, he participated in the New York, Hudson Valley annual bird count. In 1934, Congress passed the Migratory Bird Hunting & Conservation Stamp Act to restore depleting migratory-route habitats & water fowl wetlands. Conservation postage stamps funded the land acquisition projects.
